RE: Results of test conducted with Hydretain 75 on Spathiphyllum

Plants of Spathiphyllum 'Symphony'<sup>TM</sup> PPAF were grown in 8" pots at room conditions and treated with Hydretain 75 twice — 5 days apart. The dilution of Hydretain 75 was 1:15. The control plants received only water. Plants treated with Hydretain 75 wilted after 8-10 days, whereas the water only plants wilted after 4-5 days. Results indicate that Hydretain 75 reduces the necessity of watering plants by about 40-50%. Consequently, it may reduce labor, save water and help maintain plants in better condition under interior conditions.

Hydretain 75 can also be used as the treatment before shipping. In this case, plants will be exposed to less water stress during transportation.

Yours sincerely,

Marian Osiecki
